

DEFINE PROBLEM STATEMENTS

1. Problem Identification

Students frequently face difficulty in finding accurate academic information from a large collection of Frequently Asked Questions (FAQs). Traditional FAQ systems generally require users to manually search or identify the exact question.

This creates difficulty when the student asks the same question using different words or sentence structures.

2. User Problem Statement

I am	A student who needs quick answers to academic questions.
I am trying to	Find the correct answer from the available FAQs.
But	Searching through many FAQ entries manually takes time.
Because	Similar questions may be written using different words.
Which makes me feel	Confused, frustrated, and dependent on others for simple information.

3. Main Problem

Students need a simple and intelligent system that can understand their questions and provide the most relevant FAQ answer without requiring them to manually search through a large FAQ collection.

4. Proposed Solution

The **AI FAQ Assistant** is a web-based application designed to provide relevant answers to student queries through an AI-assisted FAQ matching mechanism.

5. Expected Benefits

Manual FAQ searching	AI-assisted question matching
Different wording of questions	Text similarity-based matching
Difficulty finding relevant answers	Relevant FAQ suggestions
Large FAQ collection	Category-based organization
Manual FAQ maintenance	Admin dashboard
Repeated questions	Centralized FAQ knowledge base

6. Project Objective

The main objective of the project is to develop an easy-to-use **AI FAQ Assistant** that reduces the time required to find academic information and provides relevant answers through intelligent FAQ matching.
